**Abstract:** Four species of *Pseudopaludicola*, *Pseudopaludicola boliviana*, *P. falcipes*, *P. mystacalis* and *P. ternetzi*, are usually cited for Paraguay. However, after analyzing 407 specimens assigned to this genus in herpetological collections of the country, we conclude that there are no specimens of *P. falcipes* in Paraguayan collections or vouchers cited in the literature, and almost all individuals referred to *P. ternetzi* are most probably *P. ameghini*. At the same time, a recently described species, *P. motorzinho*, is recorded for the first time in the country. Information on the distribution of these and the remaining species of *Pseudopaludicola* in Paraguay (*P. boliviana* and *P. mystacalis*) is provided.

**Key words:** Amphibia; Leiuperinae; dwarf swamp frogs; distribution assessment

## INTRODUCTION

*Pseudopaludicola* Miranda Ribeiro, 1926 currently contains 21 species, which occur mainly in the lowlands of Argentina, Bolivia, Brazil, Colombia, Guyana, Suriname, Peru, Paraguay, Uruguay and Venezuela (Frost 2016). The genus includes very small (<30 mm snout-vent length), cryptic and highly polychromatic species (Lynch 1971; Haddad and Cardoso 1987; Pansonato et al. 2013; Carvalho et al. 2015a, 2015b). The genus is diagnosed by the presence of a hypertrophied antebrachial tubercle, epicoracoid cartilages slightly (or not) superposed, posterolateral process of the hyoid outlined or absent (Lynch 1989; Lobo 1995), and by ribosomal RNA sequences (Veiga-Menoncello et al. 2014). The conservative morphology of the taxa leads to the use of acoustic, chromosomal and molecular data to address taxonomic studies (Veiga-Menoncello et al. 2014; Carvalho et al. 2015a, 2015b).

In Paraguay, four species of *Pseudopaludicola* are

usually reported: *P. falcipes* (Hensel, 1867), *P. mystacalis* (Cope, 1887), *P. boliviana* Parker, 1927 and *P. ternetzi* Miranda-Ribeiro, 1937 (see Weiler et al. 2013 and references therein). The occurrence of *P. falcipes* in Paraguay is widely cited in the literature (Freiberg 1942; Cei 1980; Gallardo 1987; Langone 1994; Aquino et al. 1996; Brusquetti and Lavilla 2006; Lavilla and Brusquetti 2010; Weiler et al. 2013 and Motte et al. 2015). More recently, the distribution of this species in Paraguay was challenged by Langone et al. (2015), based on the absence of material of this species from Paraguay in some collections of Argentina, Brazil and Uruguay. However, these authors did not analyze material from Paraguayan collections. In turn, *Pseudopaludicola ternetzi* was cited by Lobo (1995) from the departments of Amambay, Concepción, Misiones, Caaguazú, Central, and San Pedro, including under this name the putative sample cited by McDiarmid and Foster (1987) as *P. ameghini*. Brusquetti and Lavilla (2006), extended the distribution of *P. ternetzi* to the departments of Boquerón and Presidente Hayes. However, the revalidation of *Pseudopaludicola ameghini* (Cope, 1887) from the synonymy of *P. ternetzi* by Pansonato et al. (2013) generates doubts about the identification of these Paraguayan populations. Of the remaining two species cited for the country, *Pseudopaludicola mystacalis* was reported only from Itapúa Department by Lobo (1995), and *Pseudopaludicola boliviana* was first cited for Asunción (capital district) by Parker (1935). Later, Lobo (1994b) extended its range to the departments of Alto Paraguay (but stated coordinates indicate a locality in Presidente Hayes near Pozo Colorado), Amambay, Caaguazú, Central, Concepción, Cordillera, Presidente Hayes and San Pedro, and Brusquetti and Lavilla (2006) extended its distribution to Paraguari Department. Finally, in a recent contribution, Pansonato et al. (2016) described two new *Pseudopaludicola* species,

one of them, *Pseudopaludicola motorzinho* Pansonato, Veiga-Menoncello, Mudrek, Jansen, Recco-Pimentel, Martins & Strüssmann, 2016, with distribution records in the states of Mato Grosso and Mato Grosso do Sul (Brazil), and in the department Santa Cruz (Bolivia), near the Paraguay border, so we consider its presence possible in Paraguay. Faced with these expectations (the absence of *P. falcipes* and the presence of *P. motorzinho* in the Paraguayan batrachofauna), the main goals of this contribution are to provide an update of the distribution of the genus *Pseudopaludicola* in Paraguay, to investigate the presence or absence of *P. falcipes* in the country, and to reanalyze all the available material assigned to *Pseudopaludicola* in Paraguayan collections.

MATERIALS AND METHODS

We analyzed all the specimens of the genus *Pseudopaludicola* housed at Museo Nacional de Historia Natural del Paraguay (MNHNP, San Lorenzo), in the herpetological collection of the Instituto de Investigación Biológica del Paraguay (IIBP-H, Asunción) and in the Colección Zoológica of the Facultad de Ciencias Exactas y Naturales (FACEN), Universidad Nacional de Asunción (CZCEN, San Lorenzo). The identifications were corroborated following the descriptions, diagnoses and redescrptions of each species (Hensel 1867; Cope 1887; Parker 1927; Miranda-Ribeiro 1937; Lobo 1994a, 1995, 1996; Pansonato et al. 2013, 2016). Localities contained in museum catalogs were georeferenced using gazetteers (Paynter 1989; Anonymous 1992), GPS records from collectors, estimations from maps and the information in Brusquetti and Lavilla (2006). We generated the map showing the distribution of *Pseudopaludicola* species in Paraguay using ArcGIS version 10.4. For ecoregions, we follow Dinerstein et al. (1995).

RESULTS

The examination of 407 specimens of *Pseudopaludicola* from 56 localities inside Paraguay (Table 1) resulted in the identification of four *Pseudopaludicola* species in the country, *P. motorzinho* being a new record for the country, and the reassignments of all *P. falcipes* records to the four abovementioned species.

*Pseudopaludicola ameghini* (Cope, 1887):

Figures 1G and H

*Paludicola ameghini* Cope (1887): 24.

*Pseudopaludicola ameghini* — Parker (1927): 20.

Body aspect robust, larger (SVL 16–22 mm) than *P. mystacalis* (Pansonato et al. 2013). Head subtriangular in ventral view. When hind leg is adpressed, heel reaches the posterior margin of the eye. Dorsal surface of the body with planar warts, specimens lack a vertebral line, which validates the identity of the vouchers as *P. ameghini* (see Discussion). Dorsal coloration in preserved specimens uniformly brown; a few individuals with two bright dorsolateral lines (Lobo 1996), ventral coloration white, immaculate. The Paraguayan specimens attributed to this species have 2n = 20 chromosomes (Cardozo et al. 2016, as *P. ternetzi*).

*Pseudopaludicola boliviana* Parker, 1927:

Figures 1A and B, 2A and 2B

*Pseudopaludicola boliviana* — Parker (1927): 20.

*Pseudopaludicola mirandae* — Mercadal de Barrio and Barrio (1994): 16.

Tongue with small pigments at the base. Slender body, antebrachial tubercle developed; small, conical tubercle on the outer edge of heels. Toes slightly dilated distally, with T-shaped finger tips (Parker 1927; Lobo 1995, Cardozo and Suarez 2012). In addition, the presence of minute tubercles on upper eyelids (suggested by Lynch 1989) is variable (Figure 2). 2n = 20 chromosomes (Cardozo et al. 2016).

**Figure 1.** *Pseudopaludicola* species examined in Paraguayan collections. Dorsal (A) and ventral (B) views of *P. ameghini* (IIBP-H 2571). Dorsal (C) and ventral (D) views of *P. boliviana* (IIBP-H 1270). Dorsal (E) and ventral (F) views of *P. motorzinho* (IIBP-H 1087). Dorsal (G) and ventral (H) views of *P. mystacalis* (IIBP-H 289).

**Figure 2.** Detail of the upper eyelid of *Pseudopaludicola boliviana* and *P. motorzinho*. Smooth upper eyelids (A) and presence of tubercles (B) in *P. boliviana* (IIBP-H 2444, LGE 3019). Smooth upper eyelids (C) and presence of tubercles (D) in *P. motorzinho* (IIBP-H 1088, IIBP-H 1087).

***Pseudopaludicola motorzinho*** Pansonato, Veiga-Menoncello, Mudrek, Jansen, Recco-Pimentel, Martins & Strüssmann, 2016

Figures 1C and D, 2C and 2D

*Pseudopaludicola boliviana* (in part) — Parker (1927): 20; Lobo (1994b): 231; Valdujo et al. (2012): 77.

*Pseudopaludicola falcipes* (in part) — Hensel (1867): 33; Souza et al. (2010): 473.

*Pseudopaludicola* sp. — Valério-Brun et al. (2010): 124; Pansonato et al. (2011): 81; Santos et al. (2011): 456. Pansonato et al. (2014): 258; Veiga-Menoncello et al. (2014): 263.

*Pseudopaludicola* sp. A — Jansen et al. (2011): 572.

*Pseudopaludicola* sp. 1 — Fávero et al. (2011): 828; Santos et al. (2015): 1497.

*Pseudopaludicola motorzinho* is morphologically cryptic in relation to *P. boliviana*, and the difference suggested by Pansonato et al. (2016) (absence of tubercles on upper eyelid) is not diagnostic (Figure 2). The identification of *P. motorzinho* from Estancia Pirá Potrero in Amambay Department was based on 13 specimens with  $2n = 22$  chromosomes, distinguishable from *P. boliviana*, whose karyotype is  $2n = 20$  chromosomes (Fávero et al. 2011, as *Pseudopaludicola* sp.; Cardozo et al. 2016).

***Pseudopaludicola mystacalis*** (Cope, 1887):

Figures 1E and F

*Paludicola mystacalis* — Cope (1887): 24; Milstead (1963): 1963; Malnate (1971): 123.

*Physalaemus mystacalis* — Nieden (1923): 46; Parker (1927): 20.

*Pseudopaludicola mystacalis* — Haddad and Cardoso (1987): 36.

Slender body, smaller (SVL 10 to 17 mm) than *P. ternetzi* (Lobo 1996). Fingertips knobbed, head slightly elongated in ventral view. When hind leg is adpressed, heel goes beyond the eye, near the nostril. Dorsal coloration in preserved specimens brown, with few darker spots; some specimens with a vertebral line and two pale dorsolateral lines (Cope 1887; Lobo 1996), ventral coloration variable from immaculate to densely spotted.  $2n = 16$  chromosomes (Cardozo et al. 2016).

## DISCUSSION

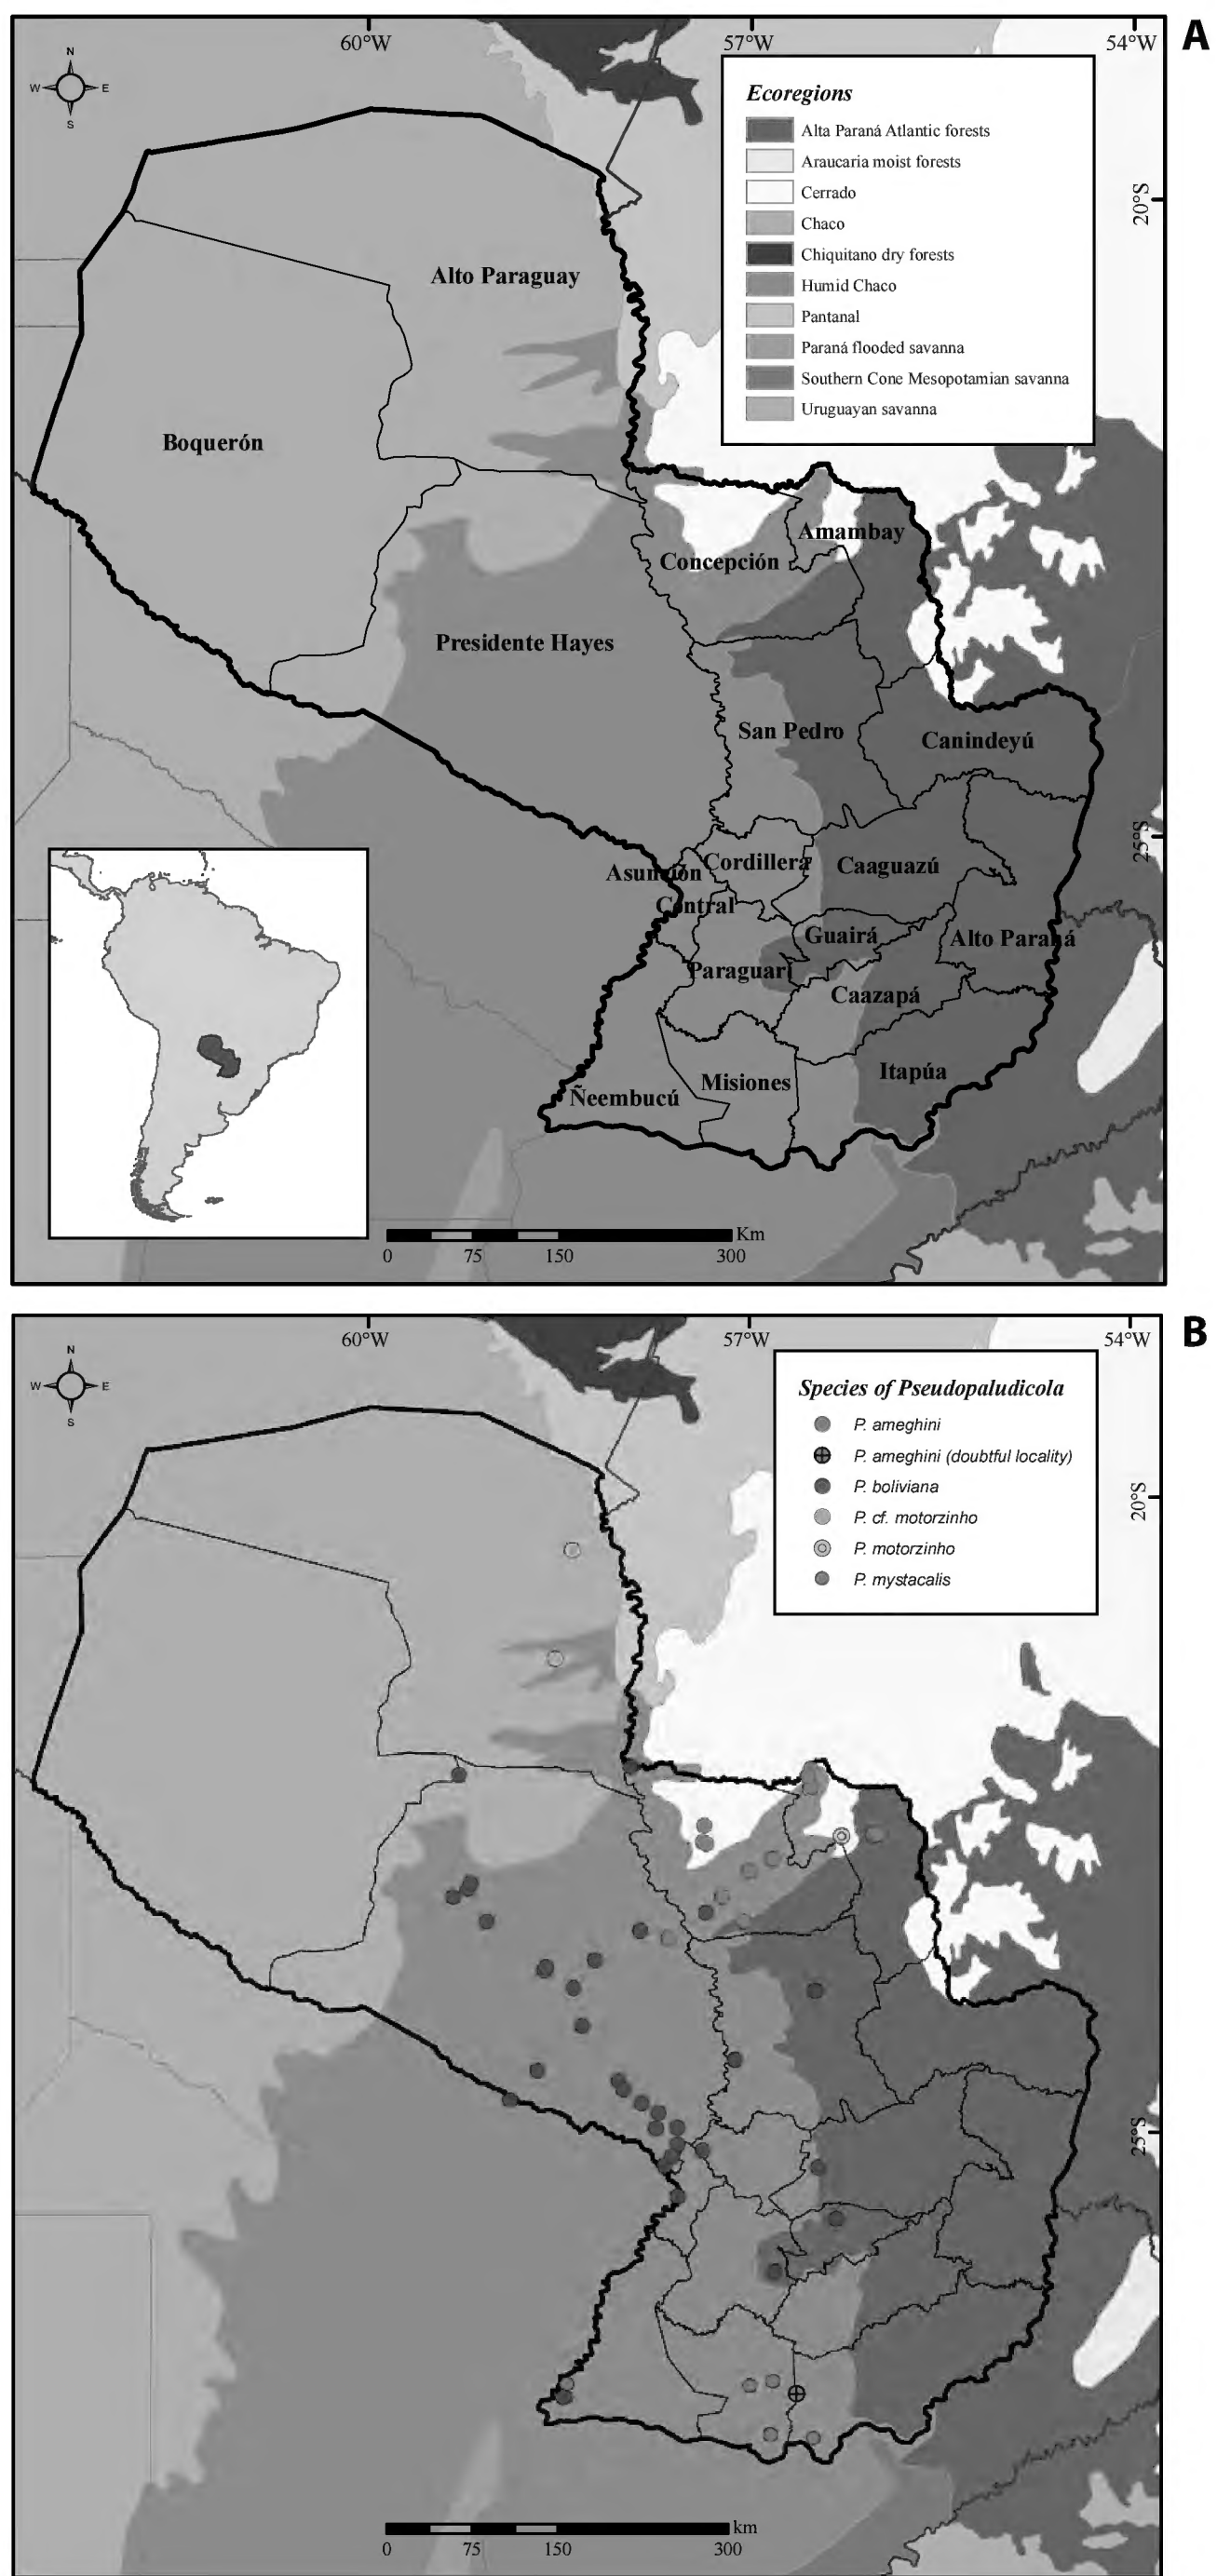

Although *Pseudopaludicola falcipes* has been the most cited species for the country, as noted above,

no specimen of *Pseudopaludicola* with an absent or incomplete abdominal fold was recorded in any of the Paraguayan collections, which supports the suggestion of Langone et al. (2015) that this species does not occur in Paraguay. Furthermore, the specimen of *P. falcipes* from Bahía Negra (Motte et al. 2015), previously identified as *P. boliviana* by Brusquetti and Lavilla (2006) and Langone et al. (2015), was tentatively re-identified as *P. motorzinho*, while those referred by Brusquetti and Lavilla (2006) were re-identified mostly as *P. mystacalis*, plus nine specimens as *P. boliviana* and one as *P. ameghini*; three individuals from Boquerón and one from Alto Paraguay were re-identified as juveniles of a species of *Physalaemus*.

*Pseudopaludicola ameghini* was found in the departments of Amambay, Concepción, Misiones and Presidente Hayes, in transitional areas between Humid Chaco, Cerrado and Atlantic Forest ecoregions (Figure 3B). The only record from Misiones (MNHNP 1209), isolated from the main distribution of the species, is doubtful and probably is a curatorial error in the transcription of collection data. The species is also distributed in Chapada dos Guimarães and Vila Bela da Santíssima Trindade, Mato Grosso, Brazil (Pansonato et al. 2013) and probably is in adjacent Bolivia (Frost 2016).

Based on the absence of a vertebral line in the examined specimens, we assigned the Paraguayan specimens, previously *Pseudopaludicola ternetzi*, to *P. ameghini*. In fact, the line, which might be present in specimens of *P. ternetzi*, is the only externally visible character suggested by Pansonato et al. (2013) to distinguish *P. ameghini* from *P. ternetzi*. However, as *P. ameghini* and *P. ternetzi* share similar external morphologies, advertisement calls with overlapping ranges (Pansonato et al. 2013; Cardozo and Toledo 2013), and chromosome number  $2n=20$  (Fávero et al. 2011; Cardozo et al. 2016, as *P. ternetzi*), we cannot discard the possibility that some of these specimens could be in fact *P. ternetzi*.

*Pseudopaludicola boliviana* is the most widely distributed species of the genus in the country (Figure 3B), mainly in the Humid Chaco ecoregion, but is also

**Figure 3.** Distribution of *Pseudopaludicola* species in Paraguay. Map of Paraguay and ecoregions (A) according to Dinerstein et al. (1995); and current distribution of species in the country (B).

present in some localities of the Atlantic Forest. The specimens from Cerrado and Dry Chaco ecoregions are probably *P. motorzinho*, although the absence of diagnostic characters in external morphology does not allow us to an accurate identification, which is also hampered by the absence of acoustic information, DNA samples or chromosomal data. Our results confirm, in part, the distribution of *P. boliviana* in Paraguay, which was previously reported by Lobo (1994b) and Brusquetti and Lavilla (2006), with the inclusion of one new departmental record in southern Ñeembucú (Estancia San José, IIBP-H 678). In South America, *P. boliviana* is distributed in two discontinuous areas (De la Riva et al. 2000), while *Pseudopaludicola motorzinho* has unquestionable records (IIBP-H 1087 and IIBP-H 1088, IIBP-H 1097 to IIBP-H 1108) from the Department of Amambay. Besides, we consider that the specimens referred as *P. falcipes* in Motte et al. (2015) and those from Laguna General Díaz (MNHNP 3826–3827, 8217) are assignable to this species. *Pseudopaludicola boliviana* and *P. motorzinho* probably inhabit in syntopy in a wide area of their distribution, and using only the morphological features mentioned by Pansonato et al. (2016), it is almost impossible to assign specimens to either species. In Paraguay, *P. motorzinho* is probably associated with Chaco Seco and Cerrado ecoregions.

*Pseudopaludicola mystacalis* is distributed in southern Paraguay (Humid Chaco), in the departments of Misiones and Ñeembucú, and western Itapúa (Figure 3B). The species was first cited for Paraguay by Lobo (1995), based on individuals in the National Museum of Natural History, Smithsonian Institution (USNM 253526 to USNM 253528), this reference followed by Brusquetti and Lavilla (2006) (not included in Figure 3, because we were unable to examine the specimens). The general distribution of *P. mystacalis* also includes Argentina (Santa Fé and Entre Ríos provinces; Alcalde and Williams 2004), Bolivia (Beni and Santa Cruz departments; De la Riva et al. 2002) and Brazil (São Paulo, Goiás, Mato Grosso, Mato Grosso do Sul, Piauí, Maranhão and Pará states; Pansonato et al. 2014).

## ACKNOWLEDGEMENTS

The authors are grateful to the curators and personnel of the collections studied: Humberto Sánchez, Flavia Netto and Francisco Brusquetti (IIBP); Frederick Bauer and Nicolás Martínez (MNHNP); and Andrea Weiler and Katia Airaldi (CZCEN). We thank Diego Baldo for comments that improved the work, Guyra Paraguay for the ArcGis 10.4 license for map preparation. We also wish to thank Silvia de Oliveira-Lagoa, and the support of CONICET Argentina through PIP No. 0875, FONCYT PICT 2014-1343, and PRONII-CONACYT Paraguay. We take this opportunity to thank the reviewers and academic editor for suggestions and comments that improved the work.
